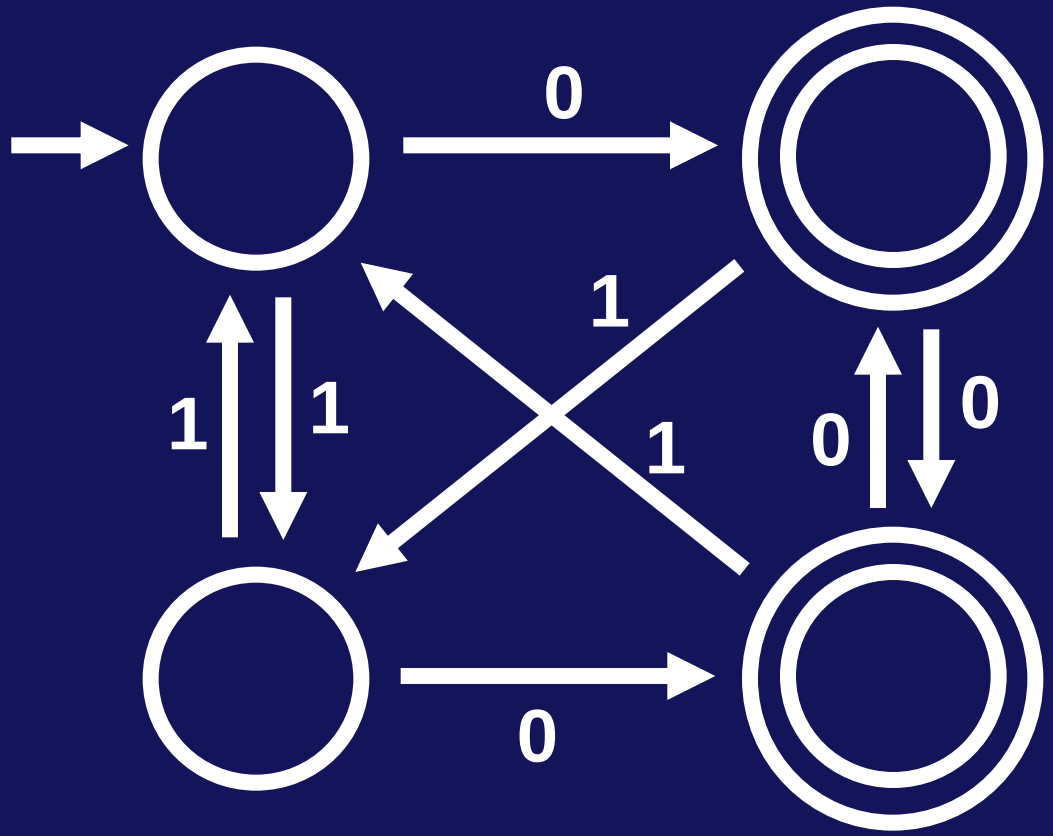
MINIMIZING DFAs

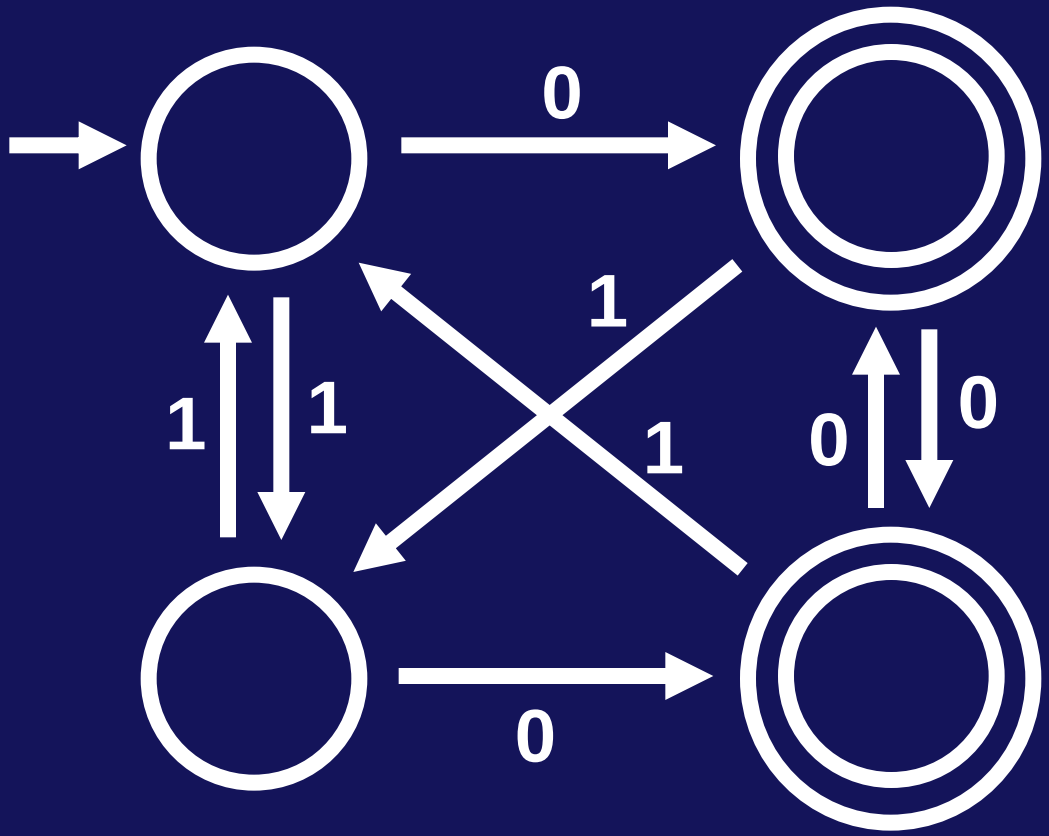
To have minimum number of states

IS THIS **MINIMAL?**

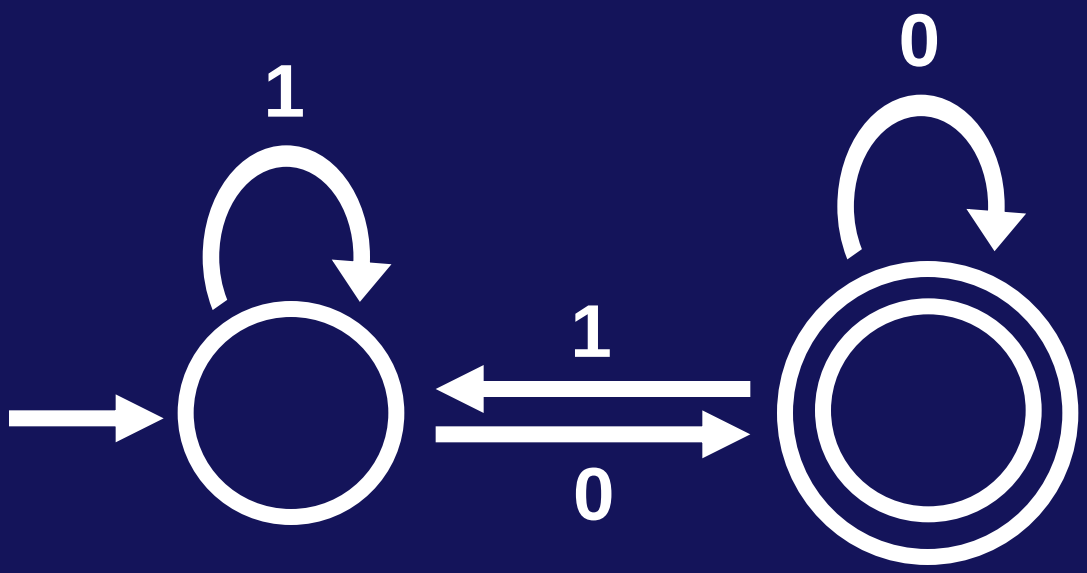


IS THIS **MINIMAL?**

NO



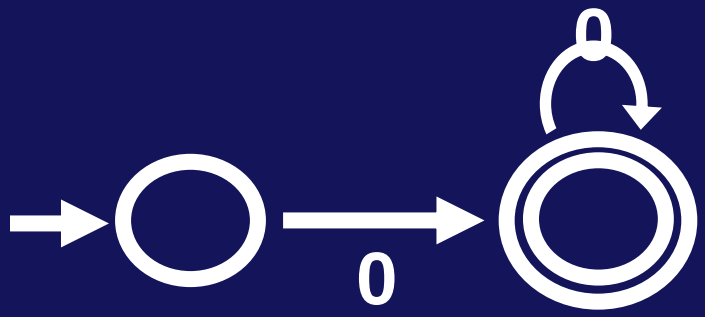
IS THIS **MINIMAL?**

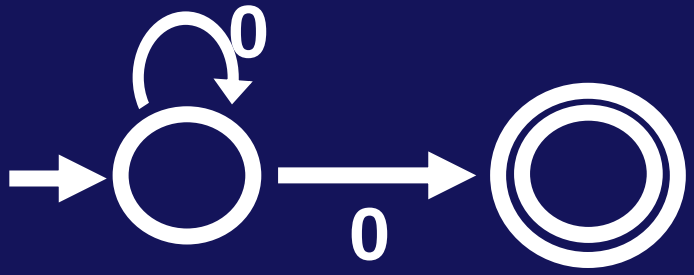


THEOREM

For every regular language L, there exists a unique (up to re-labeling of the states) minimal DFA M such that L = L(M)

NOT TRUE FOR NFAs





Because of this, minimization of NFA is complicated and is out of scope of current ToC course.

EXTENDING δ

Given DFA $M = (Q, \Sigma, \delta, q_0, F)$ extend δ to $\hat{\delta} : Q \times \Sigma^* \rightarrow Q$ as follows:

$$\hat{\delta}(q, \varepsilon) = q$$

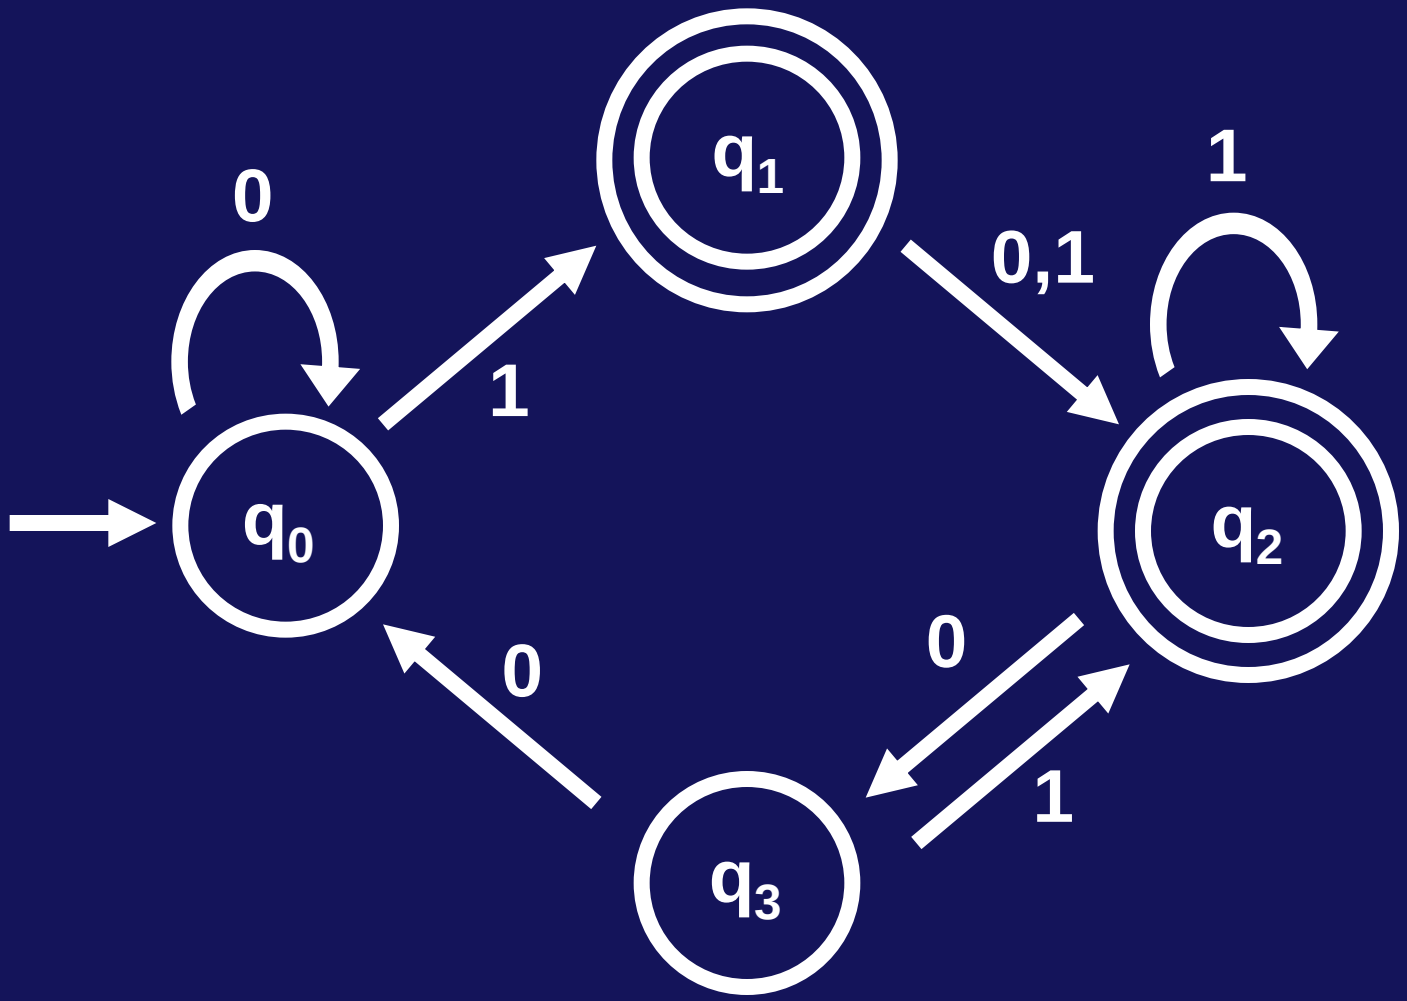
$$\hat{\delta}(q, a) = \delta(q, a) \text{ where } a \in \Sigma$$

$$\hat{\delta}(q, w_1 \ldots w_{k+1}) = \delta(\hat{\delta}(q, w_1 \ldots w_k), w_{k+1})$$

Note: in $\hat{\delta}(q, a)$, a is a string. Context should clear this.

A string $w \in \Sigma^*$ **distinguishes states** q_1 **from** q_2 **if**

$$\hat{\delta}(q_1, w) \in F \Leftrightarrow \hat{\delta}(q_2, w) \notin F$$



ε distinguishes accept from non-accept states

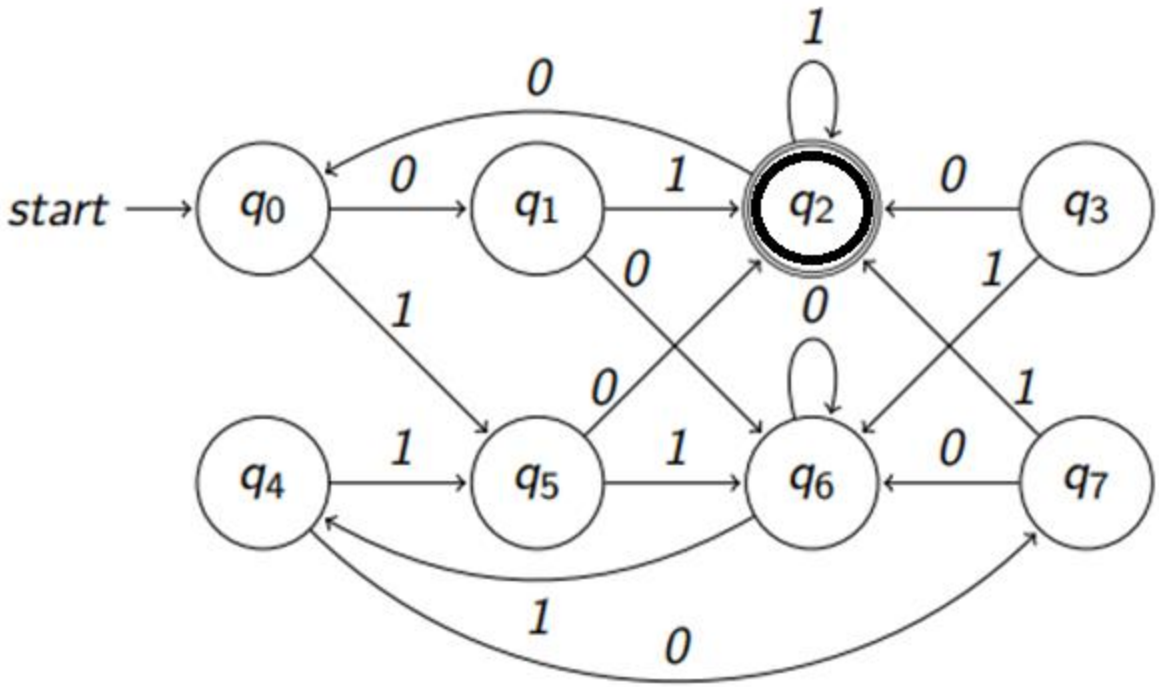
Let $M = (Q, \Sigma, \delta, q_0, F)$ and let $p, q, r \in Q$

Definition **:**

(1) p is equivalent to q iff there is *no* $w \in \Sigma^*$ that distinguishes p and q,

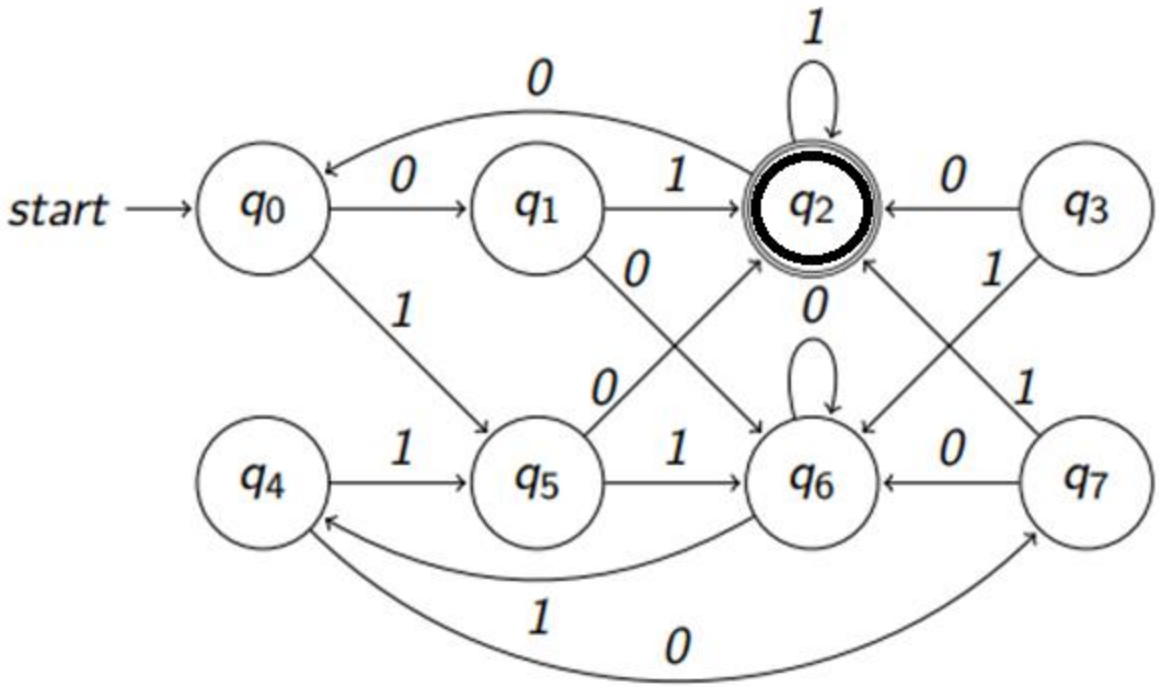
(2) Otherwise p is not equivalent to q. In this case, we say p and q are distinguishable.

Example: distinguishable states



- ϵ *distinguishes* q_2 *and* q_6.
- 01 *distinguishes* q_0 *and* q_6.

Example: distinguishable states



- ϵ *distinguishes* q_2 *and* q_6.
- 01 *distinguishes* q_0 *and* q_6.

Exercise

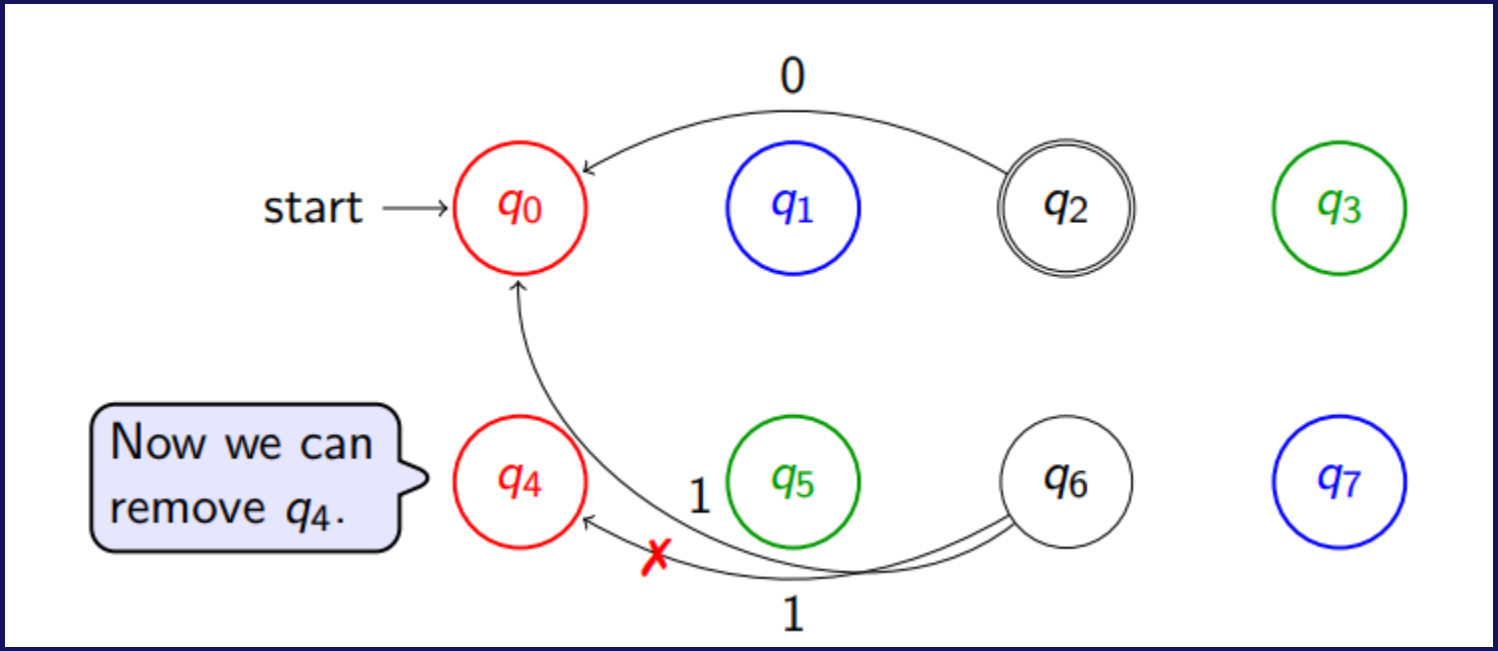
Give strings that distinguishes the following pair of states.

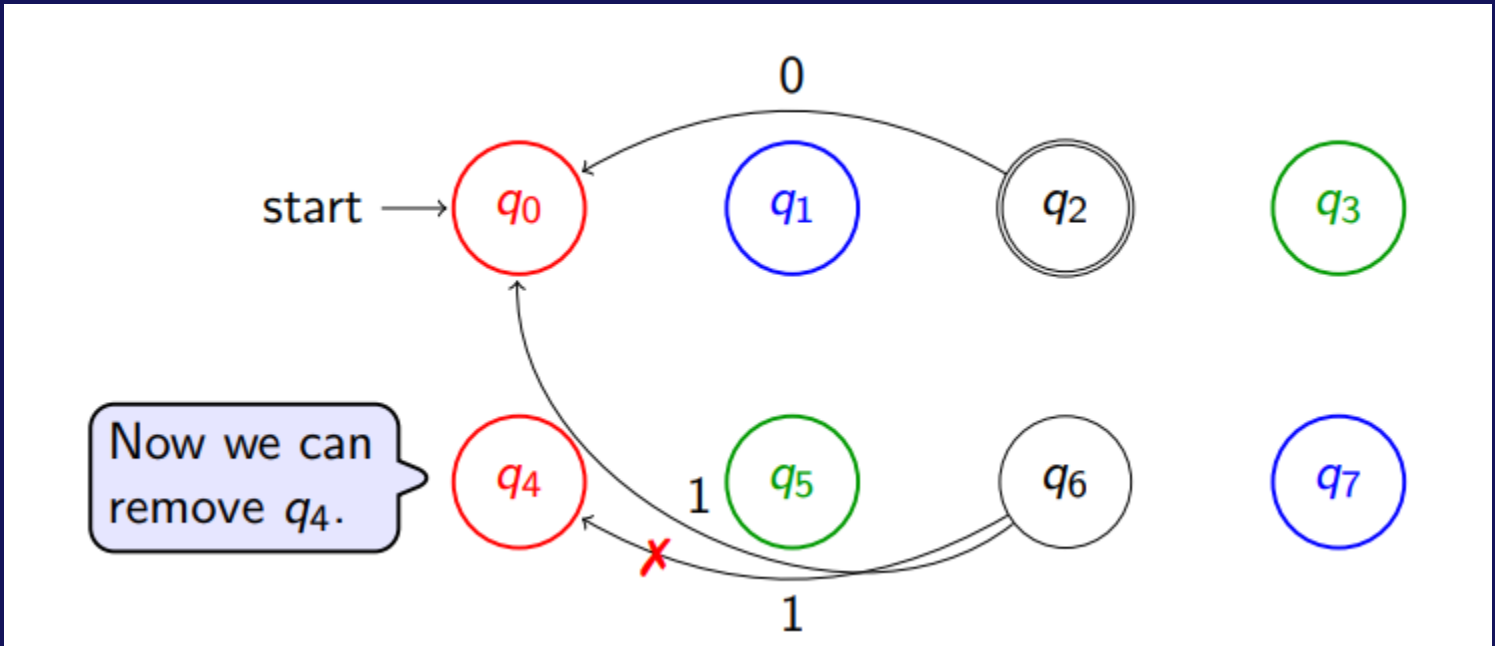
- q_1 *and* q_5
- q_2 *and* q_7
- q_4 *and* q_3
- q_1 *and* q_7

DFA Minimization, intuition

- We can remove unreachable states (why and how to find unreachable states?)
- If states q_0 and q_4 are equivalent, then, we can move all incoming transitions (arrows) from q_4 to q_0
- Because of this q_4 becomes unreachable, hence can be removed.

Let q_0 *and* q_4 *are equivalent*





- But, how is that you know q_0 *and* q_4 *are equivalent*?

Let $M = (Q, \Sigma, \delta, q_0, F)$ and let $p, q, r \in Q$

Define the relation "~":

$p \sim q$ iff p is equivalent to q

$p \not\sim q$ iff p is distinguishable from q

Proposition: "~" is an equivalence relation

$p \sim p$ (reflexive)

$p \sim q \Rightarrow q \sim p$ (symmetric)

$p \sim q$ and $q \sim r \Rightarrow p \sim r$ (transitive)

Let $M = (Q, \Sigma, \delta, q_0, F)$ and let $p, q, r \in Q$

Proposition: "~" is an **equivalence relation**

so "~" partitions the set of states of M into disjoint equivalence classes

$[q] = \{ p \mid p \sim q \}$

Algorithm MINIMIZE(DFA M)

Input: DFA M

Output: DFA M_{MIN} such that:

$M \equiv M_{MIN}$

M_{MIN} **has no inaccessible states**

M_{MIN} **is irreducible**

||

states of M_{MIN} are pairwise distinguishable

Theorem: M_{MIN} is the unique minimum

Algorithm MINIMIZE(DFA *M*)

(1) Remove all inaccessible states from M

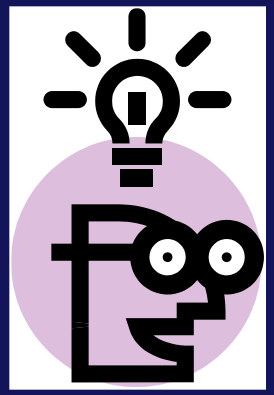
(2) Apply Table-Filling algorithm to get
$E_M = \{ [q] \mid q \text{ is an accessible state of } M \}$

$$M_{MIN} = (Q_{MIN}, \Sigma, \delta_{MIN}, q_{0\,MIN}, F_{MIN})$$

$$Q_{MIN} = E_M, \quad q_{0\,MIN} = [q_0], \quad F_{MIN} = \{ [q] \mid q \in F \}$$

$$\delta_{MIN}([q], a) = [\delta(q, a)]$$

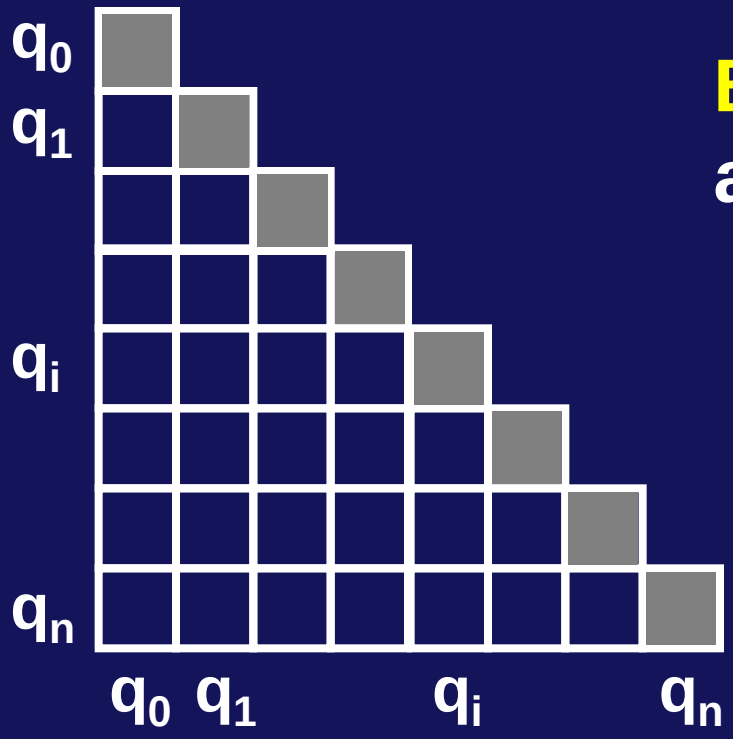
TABLE-FILLING ALGORITHM



IDEA!

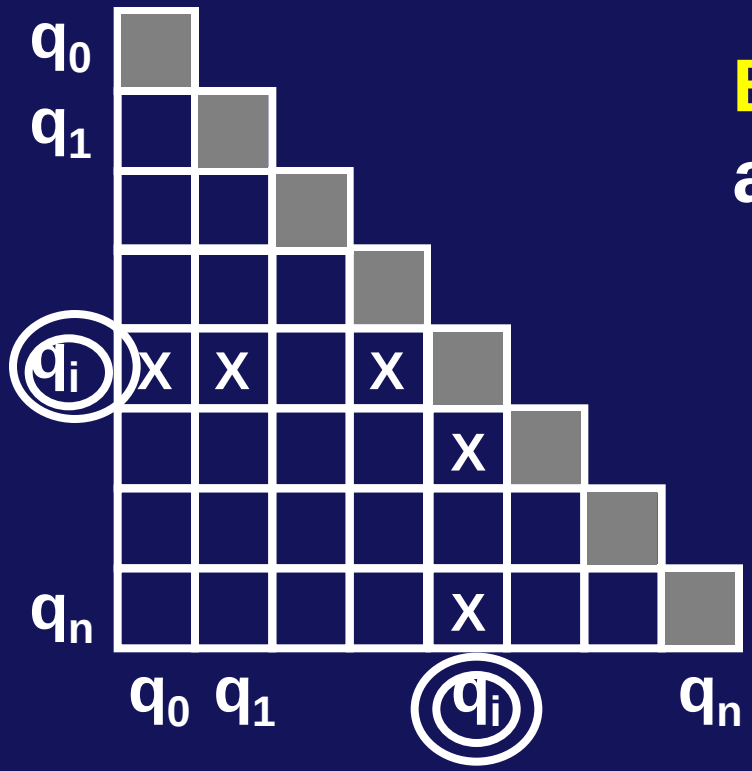
- **Make best effort to find pairs of states that are distinguishable.**
- **Pairs leftover will help us.**

TABLE-FILLING ALGORITHM



Base Case: p accepts and q rejects $\Rightarrow$ p $\not\equiv$ q

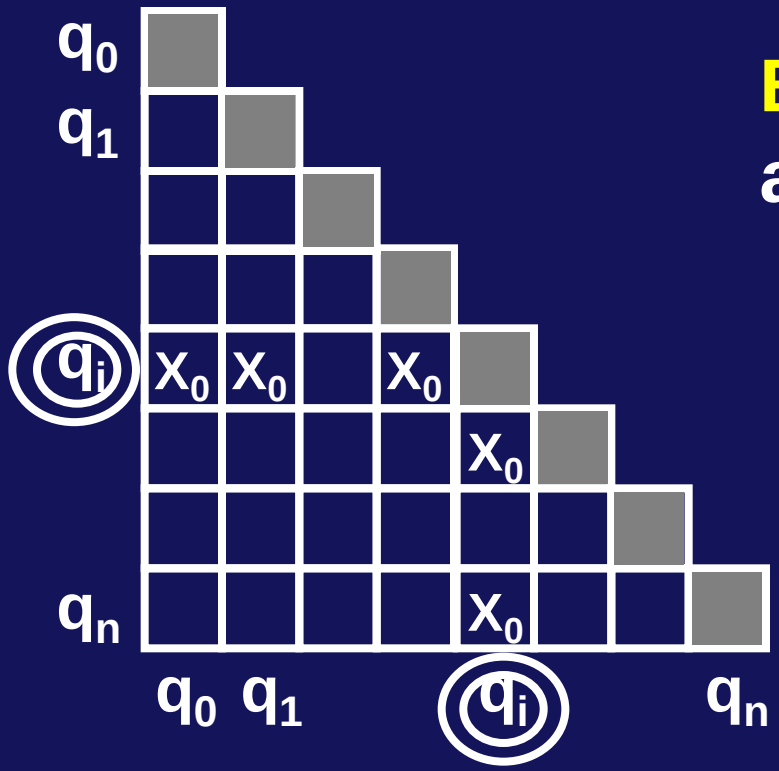
TABLE-FILLING ALGORITHM



Base Case: p accepts and q rejects $\Rightarrow$ p $\not\equiv$ q

TABLE-FILLING ALGORITHM

For base case, we put X_0 in the corresponding cell.
This states, that the two states are not equivalent.



Base Case: p accepts and q rejects $\Rightarrow$ p $\not\sim$ q

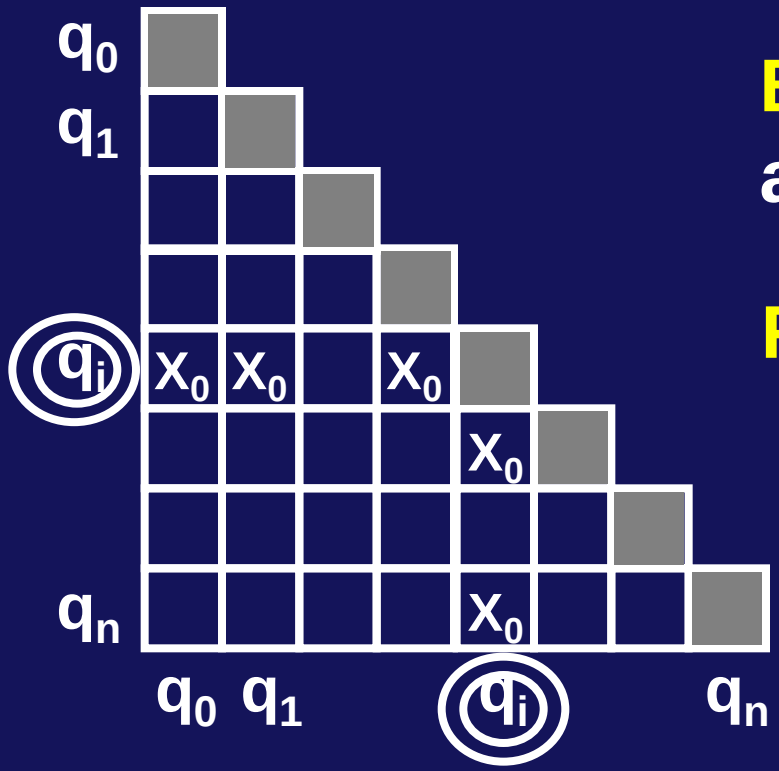
$q \not\sim s$

$\not\Rightarrow$

$p \not\sim r$

TABLE-FILLING ALGORITHM

For base case, we put X_0 in the corresponding cell.
This states, that the two states are not equivalent.



Base Case: p accepts and q rejects $\Rightarrow$ p $\not\sim$ q

Recursion:

$$p \xrightarrow{a} r$$

$$\not\sim \Rightarrow p \not\sim q$$

$$q \xrightarrow{a} s$$

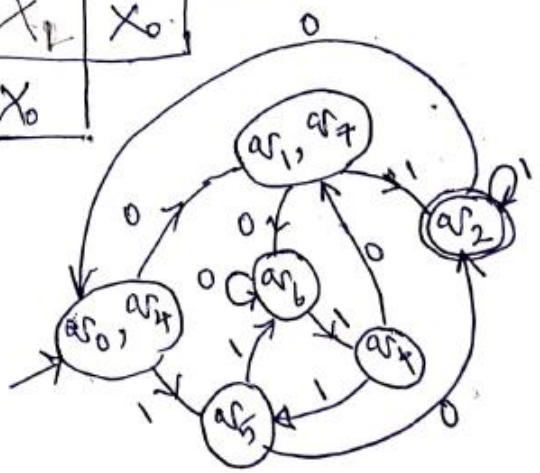
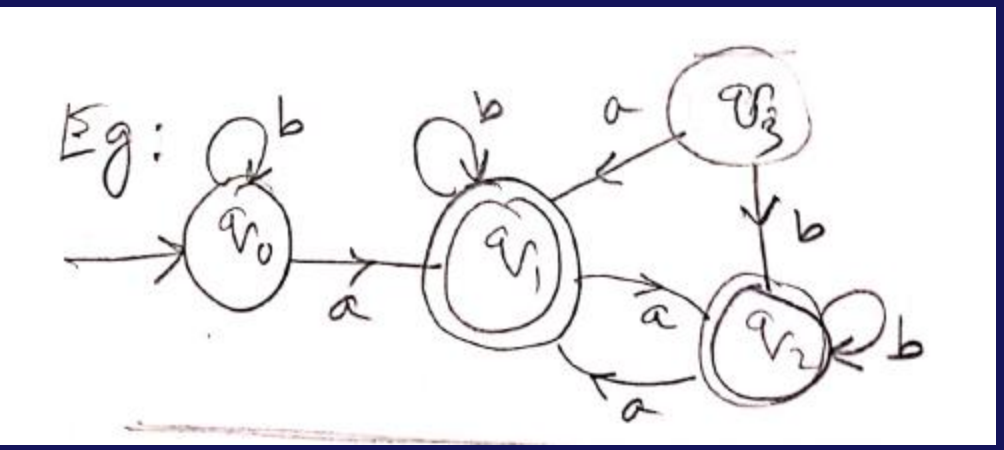
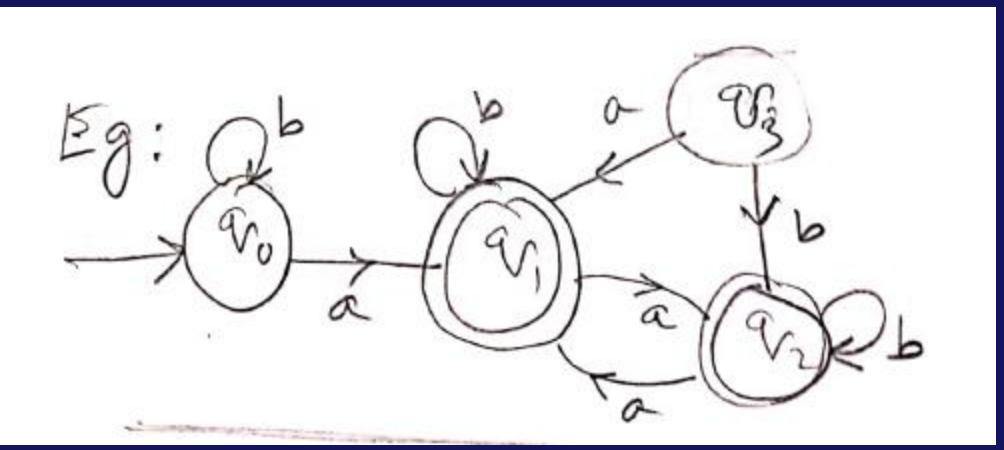
q_4	X_1	X_2	X_1			
q_5	X_1	X_1				
q_6	X_1					

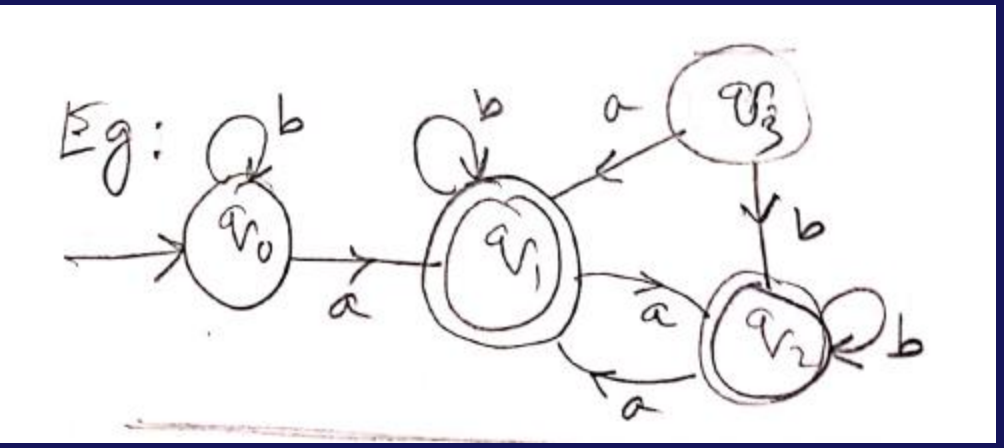




Eg:
b
b
a
q_0
q_1
q_2
a
b
a
b
a

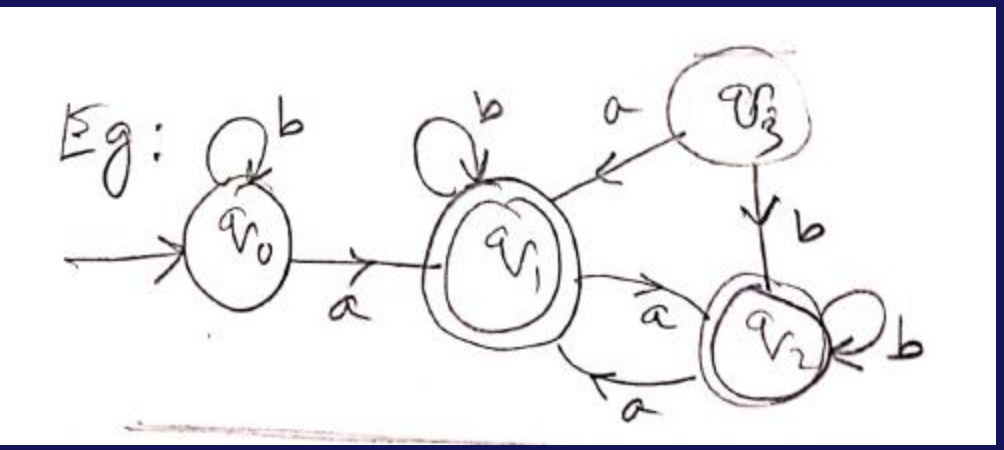


Unreachable = q_3



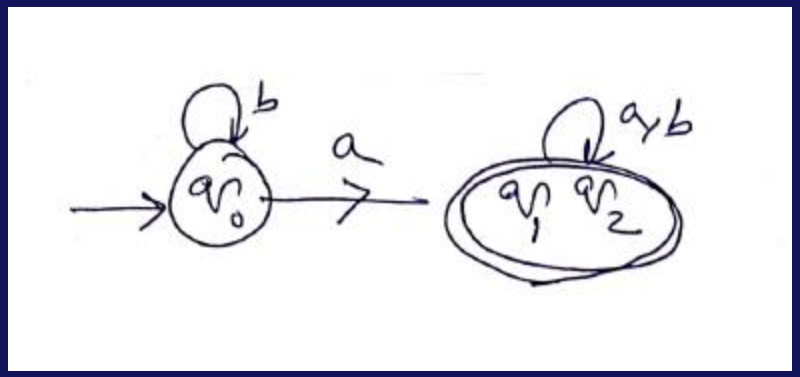
Unreachable = q_3

We get q_1 is equivalent to q_2 (how?)



Unreachable = q_3

We get q_1 is equivalent to q_2 (how?)



Minimal DFA

HOW TO PROVE THAT TWO DFAs ARE EQUIVALENT

- The following is an extract from the Ullman’s book.
- Read that book for more information (Reading assignment)

4.4.2 Testing Equivalence of Regular Languages

The table-filling algorithm gives us an easy way to test if two regular languages are the same. Suppose languages L and M are each represented in some way, e.g., one by a regular expression and one by an NFA. Convert each representation to a DFA. Now, imagine one DFA whose states are the union of the states of the DFA's for L and M. Technically, this DFA has two start states, but actually the start state is irrelevant as far as testing state equivalence is concerned, so make any state the lone start state.

Now, test if the start states of the two original DFA's are equivalent, using the table-filling algorithm. If they are equivalent, then $L = M$, and if not, then $L \neq M$.

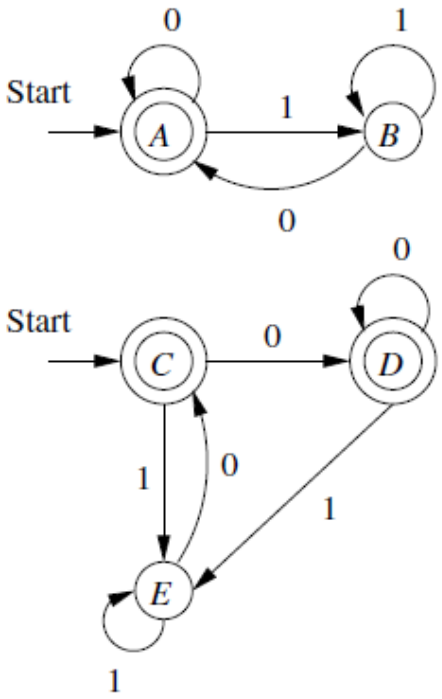


Figure 4.10: Two equivalent DFA's
